### Match vs switch

match and switch are conditional statements used for making decisions based on different values.

switch is a control structure that allows you to evaluate an expression and execute different blocks of code based on its value. You provide multiple case statements, and if a case matches the expression, the corresponding block of code is executed. On the other hand, match, also known as the match expression, is a more recent addition in PHP 8.0. It provides a simple way to perform pattern matching on expressions. It matches an expression to a set of possible values and returns a corresponding value based on the match. Here's an example

Both switch and match can help you make decisions based on different values, but match provides a more concise and expressive syntax for pattern matching.
